

Lesson 56 Footer Design

Remainder:

```
<body>
```

```
header
```

```
page
```

```
footer
```

```
</body>
```

We have already done the header, now we are going to code the footer part.

Don't forget that we need html code for the footer and css code, So don't forget to add in the class of footer in private two string attributes , one for the html code and the other one for the css.

For the methods, like we did in the header, 4 methods.

```
class footer {  
    private:  
        string htmlcode, csscode;  
    public:  
        void ChooseFooter ( ) {  
            }  
        void generateCode ( ) {  
            }  
        string getHtml ( ) {  
            return htmlcode;  
        }  
}
```

Footer f.
getHtml()
header h;
h.getHtml();
