

Lesson 62 Website Design

<head>

..

</head>

<body>

header

page

footer

</body>

We have already done the body part, now we are going to create the **website class** that's going to contain the head tags like title, background color of website etc and the body part.

```
Website  
private:  
    vector<string> pageName;  
    string websiteName;  
    string backgroundColor;  
public:  
    void CreateWebsite()  
    {  
        //  
    }
```

You can either create one method that collects the information from the other classes and create the website, or you can divide this method into many methods.

The main would be like that :

```
int main() {  
    website w;  
    w.createWebsite();  
}
```
