## Lesson 51 Project design

Lately in the C programming Course, we created a program that generates a website.

Now it's much easier in Cpp programming, especially with the oop, because we can work as a team on that project.

First thing we have to create a class for each entity in the project.

A class for the header, which means the team or the person working on that class, doesn't know the rest of the classes and can't modify them. You can create a main for each class to test it and to avoid making errors. But in the end you will find one main that contains all the calls of the classes in the project.
